Issues with arrays 2

Outline

- In this lesson, we will:
 - Describe the idea of a linked list
 - Describe a simple variation of a linked list that you can implement
 - Add values to this linked list
 - Consider some issues and benefits of linked lists

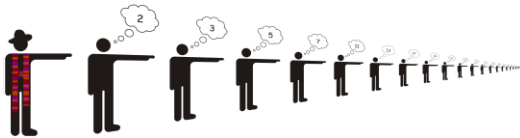

2

FACULTY OF ENGINEERING
Department of Electrical & Computer Engineering

Issues with arrays 3

Nodes

- Suppose I want to remember some numbers
 - I could use this class

3

UNIVERSITY OF WATERLOO
FACULTY OF ENGINEERING
Department of Electrical & Computer Engineering

Issues with arrays 4

Nodes

- Each student is remembering two pieces of information:
 - A number
 - The next student
- This sound like a class, and we will call this class a *node*:

```
class Node {
    public:
        double value_;
        ??? next_;
};
```

4

Nodes

- Let assume we have an array of these nodes, thus, we could identify each node with an *index*

```
class Node {
public:
    double    value_;
    std::size_t next_index_;
};
```

- Thus, we could have the nodes as follows:

```
std::size_t const list_cap{10};
Node a_nodes[list_cap]{};

for ( std::size_t k{0}; k < list_cap; ++k ) {
    a_nodes[k].next_index_ = list_cap + 1; // indicates not used
}
```

- All the program need do is remember the first index
 - The *head* of the linked list

```
std::size_t list_head{ list_cap };
```

5

Nodes

- Thus, we have:

```
int main() {
    std::size_t const list_cap{10};
    Node a_nodes[list_cap]{};

    for ( std::size_t k{0}; k < list_cap; ++k ) {
        a_nodes[k].next_index_ = list_cap + 1;
    }

    std::size_t list_head{ list_cap };

    // Let us use this linked list

    return 0;
}
```

6

Nodes

- Without coding, let's see what we'd like to do:
 - Here is our initial set-up:

	10	list_head								
	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
next_index_	11	11	11	11	11	11	11	11	11	11

7

Nodes

- Without coding, let's see what we'd like to do:
 - To add 4.2, we
 - Find an unused node
 - Set the value and its next index to 10 to indicate it is the last node
 - Remember that index

	5	list_head								
	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	0.0	0.0	0.0	4.2	0.0	0.0	0.0	0.0
next_index_	11	11	11	11	11	10	11	11	11	11

FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 9

Nodes

- Without coding, let's see what we'd like to do:
 - To add 9.1, we
 - Find an unused node
 - Set the value and its next index to 5
 - Remember that index

	2	list_head								
	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	0.0	0.0	0.0
next_index_	11	11	5	11	11	10	11	11	11	11

Issues with arrays 10

Nodes

- Without coding, let's see what we'd like to do:
 - To add 6.3, we
 - Find an unused node
 - Set the value and its next index to 2
 - Remember that index

	7	list_head								
	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	6.3	0.0	0.0
next_index_	11	11	5	11	11	10	11	2	11	11

10

UNIVERSITY OF WATERLOO

FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 11

Nodes

- We can see why this is called a *linked list*

	7	list_head								
	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	6.2	0.0	0.0
next_index_	11	11	5	11	11	10	11	2	11	11

Diagram illustrating a linked list structure. Blue arrows show the sequence of nodes: list_head (index 7) points to index 7, which points to index 2, which points to index 5, which points to index 10, which points to index 11, which points to index 11, which points to index 11.

Issues with arrays 12

Nodes

- Could we program a walk through this linked list?

```
std::size_t index{ list_head };

while ( index != list_cap ) {
    std::cout << a_nodes[index].value_ << std::endl;
    index = a_nodes[index].next_index_;
}

7 list_head
```

	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	6.2	0.0	0.0
next_index_	11	11	5	11	11	10	11	2	11	11

12

UNIVERSITY OF WATERLOO
FACULTY OF ENGINEERING
FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 13

Nodes

- In fact, this could be a for loop:

```
for ( std::size_t index{ list_head }; index != list_cap;
      index = a_nodes[index].next_index_ ) {
    std::cout << a_nodes[index].value_ << std::endl;
}
```

7 list_head

	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	6.2	0.0	0.0
next_index_	11	11	5	11	11	10	11	2	11	11

13

FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 14

Questions

- How would you do the following?
 - Add a node to the end of the linked list, not the start
 - Remove the first node from the linked list
 - This assumes there is at least one node in that linked list
 - Remove the last node from the linked list
 - What happens if there is only one node in the linked list?
 - Remove an arbitrary node in the linked list?
 - What would you do to a removed node to ensure it can be reused?

14

UNIVERSITY OF WATERLOO
FACULTY OF ENGINEERING
FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 15

Question

- What happens if we accidentally execute the following?

```
if ( list_head = 0 ) {
    std::cout << "We are at the array[0]" << std::endl;
}
```

0 list_head

	0	1	2	3	4	5	6	7	8	9
value_	0.0	0.0	9.1	0.0	0.0	4.2	0.0	6.2	0.0	0.0
next_index_	11	11	5	11	11	10	11	2	11	11

15

UNIVERSITY OF WATERLOO
FACULTY OF ENGINEERING
FACULTY OF INFORMATION AND COMMUNICATIONS

Issues with arrays 16

Issue

- Once again, we are restricted to the capacity of our array
 - Would it not be better to get each node from the operating system?
 - Benefit: as long as there is memory available, we can continue to build our linked list
 - Drawback: asking for new memory is actually sort-of slow... ☹

16

Summary

- Following this lesson, you now
 - Understand the idea of a node within a linked list
 - Know that it is only necessary to store the first index
 - Know that each node stores the index of the next node
 - Understand how you can add additional nodes to this linked list
 - Have a few questions to work out before your next lecture
 - Know that there are problems with the current design
